

## Secret - Sharing

# Motivating Problem

# Motivating Problem

- ▶ Eleven scientists are working on a secret project. They wish to lock up the documents in a cabinet so that the cabinet can be opened if and only if six or more of the scientists are present.

# Motivating Problem

- ▶ Eleven scientists are working on a secret project. They wish to lock up the documents in a cabinet so that the cabinet can be opened if and only if six or more of the scientists are present.
  - ▶ What is the smallest number of locks needed?

# Motivating Problem

- ▶ Eleven scientists are working on a secret project. They wish to lock up the documents in a cabinet so that the cabinet can be opened if and only if six or more of the scientists are present.
  - ▶ What is the smallest number of locks needed?
  - ▶ What is the smallest number of keys to the locks each scientist must carry?

# Motivating Problem

- ▶ Eleven scientists are working on a secret project. They wish to lock up the documents in a cabinet so that the cabinet can be opened if and only if six or more of the scientists are present.
  - ▶ What is the smallest number of locks needed?
  - ▶ What is the smallest number of keys to the locks each scientist must carry?
- ▶ It is left as an exercise to show that the minimal solution uses 462 locks and 252 keys per scientist.

# Motivating Problem

- ▶ Eleven scientists are working on a secret project. They wish to lock up the documents in a cabinet so that the cabinet can be opened if and only if six or more of the scientists are present.
  - ▶ What is the smallest number of locks needed?
  - ▶ What is the smallest number of keys to the locks each scientist must carry?
- ▶ It is left as an exercise to show that the minimal solution uses 462 locks and 252 keys per scientist.
- ▶ This is impractical, and the numbers grow exponentially.

# Threshold Schemes

# Threshold Schemes

- ▶ We have some secret data  $D$ .

# Threshold Schemes

- ▶ We have some secret data  $D$ .
- ▶ We wish to “break” this data in  $n$  pieces  $D_1, \dots, D_n$  such that:

# Threshold Schemes

- ▶ We have some secret data  $D$ .
- ▶ We wish to “break” this data in  $n$  pieces  $D_1, \dots, D_n$  such that:
  - ▶ knowledge of  $k$  or more  $D_i$  pieces makes  $D$  easily computable.

# Threshold Schemes

- ▶ We have some secret data  $D$ .
- ▶ We wish to “break” this data in  $n$  pieces  $D_1, \dots, D_n$  such that:
  - ▶ knowledge of  $k$  or more  $D_i$  pieces makes  $D$  easily computable.
  - ▶ knowledge of strictly less than  $k$  pieces leaves  $D$  completely undetermined (so all possible values are equally likely).

# Threshold Schemes

- ▶ We have some secret data  $D$ .
- ▶ We wish to “break” this data in  $n$  pieces  $D_1, \dots, D_n$  such that:
  - ▶ knowledge of  $k$  or more  $D_i$  pieces makes  $D$  easily computable.
  - ▶ knowledge of strictly less than  $k$  pieces leaves  $D$  completely undetermined (so all possible values are equally likely).
- ▶ Such a scheme is called a  $(k, n)$  *threshold scheme*.

# Shamir's Threshold Scheme

# Shamir's Threshold Scheme

- ▶  $D$  is some element of a field  $\mathbb{F}$ .

# Shamir's Threshold Scheme

- ▶  $D$  is some element of a field  $\mathbb{F}$ .
- ▶ Pick a degree  $k - 1$  polynomial  $q(x)$  from  $\mathbb{F}[x]$  with constant term  $D$ .

# Shamir's Threshold Scheme

- ▶  $D$  is some element of a field  $\mathbb{F}$ .
- ▶ Pick a degree  $k - 1$  polynomial  $q(x)$  from  $\mathbb{F}[x]$  with constant term  $D$ .
- ▶ Set  $D_i = q(i)$ .

# Shamir's Threshold Scheme

- ▶  $D$  is some element of a field  $\mathbb{F}$ .
- ▶ Pick a degree  $k - 1$  polynomial  $q(x)$  from  $\mathbb{F}[x]$  with constant term  $D$ .
- ▶ Set  $D_i = q(i)$ .
- ▶ Given any  $k$  of these  $D_i$  values, we can use interpolation to find the coefficients of  $q$ , and then  $D = q(0)$ .

# Shamir's Threshold Scheme

- ▶  $D$  is some element of a field  $\mathbb{F}$ .
- ▶ Pick a degree  $k - 1$  polynomial  $q(x)$  from  $\mathbb{F}[x]$  with constant term  $D$ .
- ▶ Set  $D_i = q(i)$ .
- ▶ Given any  $k$  of these  $D_i$  values, we can use interpolation to find the coefficients of  $q$ , and then  $D = q(0)$ .
- ▶ Given  $k - 1$  of these  $D_i$  values, we can do nothing.

# Blakley's Threshold Scheme

## Blakley's Threshold Scheme

- ▶ Let  $\mathbb{V}$  be a  $k$ -dimensional vector space over  $GF(q)$  and let  $\mathbf{e}$  be the  $k$ -dimensional vector  $[1, 0, \dots, 0]$ .

## Blakley's Threshold Scheme

- ▶ Let  $\mathbb{V}$  be a  $k$ -dimensional vector space over  $GF(q)$  and let  $\mathbf{e}$  be the  $k$ -dimensional vector  $[1, 0, \dots, 0]$ .
- ▶ Let  $g$  be the first coordinate axis and pick a  $(k - 1)$ -dimensional flat  $H$  such that  $g \cap H = P$ .

## Blakley's Threshold Scheme

- ▶ Let  $\mathbb{V}$  be a  $k$ -dimensional vector space over  $GF(q)$  and let  $\mathbf{e}$  be the  $k$ -dimensional vector  $[1, 0, \dots, 0]$ .
- ▶ Let  $g$  be the first coordinate axis and pick a  $(k - 1)$ -dimensional flat  $H$  such that  $g \cap H = P$ .
- ▶  $D$  is the first coordinate of  $P$ .

## Blakley's Threshold Scheme

- ▶ Let  $\mathbb{V}$  be a  $k$ -dimensional vector space over  $GF(q)$  and let  $\mathbf{e}$  be the  $k$ -dimensional vector  $[1, 0, \dots, 0]$ .
- ▶ Let  $g$  be the first coordinate axis and pick a  $(k - 1)$ -dimensional flat  $H$  such that  $g \cap H = P$ .
- ▶  $D$  is the first coordinate of  $P$ .
- ▶ The pieces  $D_1, \dots, D_n$  are the first coordinates of points that are in general position with  $P$  – any  $k$  of them generate a  $(k - 1)$ -dimensional flat. The other coordinates are public knowledge.

## Blakley's Threshold Scheme

- ▶ Let  $\mathbb{V}$  be a  $k$ -dimensional vector space over  $GF(q)$  and let  $\mathbf{e}$  be the  $k$ -dimensional vector  $[1, 0, \dots, 0]$ .
- ▶ Let  $g$  be the first coordinate axis and pick a  $(k - 1)$ -dimensional flat  $H$  such that  $g \cap H = P$ .
- ▶  $D$  is the first coordinate of  $P$ .
- ▶ The pieces  $D_1, \dots, D_n$  are the first coordinates of points that are in general position with  $P$  – any  $k$  of them generate a  $(k - 1)$ -dimensional flat. The other coordinates are public knowledge.
- ▶ Given any  $k$  of these  $D_i$  values we can generate  $H$  and hence  $D$ .

## Blakley's Threshold Scheme

- ▶ Let  $\mathbb{V}$  be a  $k$ -dimensional vector space over  $GF(q)$  and let  $\mathbf{e}$  be the  $k$ -dimensional vector  $[1, 0, \dots, 0]$ .
- ▶ Let  $g$  be the first coordinate axis and pick a  $(k - 1)$ -dimensional flat  $H$  such that  $g \cap H = P$ .
- ▶  $D$  is the first coordinate of  $P$ .
- ▶ The pieces  $D_1, \dots, D_n$  are the first coordinates of points that are in general position with  $P$  – any  $k$  of them generate a  $(k - 1)$ -dimensional flat. The other coordinates are public knowledge.
- ▶ Given any  $k$  of these  $D_i$  values we can generate  $H$  and hence  $D$ .
- ▶ Given  $k - 1$  of these  $D_i$  values we can do nothing as there is a hyperplane passing through all  $k - 1$  points and any given point on  $g$ .

# Terminology

# Terminology

- ▶ As  $\Gamma$  is monotone, defining the *minimal authorised subsets*  $\Gamma_0$  is sensible.
- ▶ The matroid on  $\Gamma$  is defined by:

$$\Gamma_0 = \{A \subseteq \mathcal{P} \mid A \cup \{D\} \text{ is a circuit of } \mathbf{M}\}$$

- ▶ These matroids are **not** secret-sharing matroids.

# Matroids

- ▶ Given an access structure  $\Gamma$ , we can define a matroid  $\mathbf{M}$  with groundset  $\mathcal{P} \cup \{D\}$ .
- ▶ As  $\Gamma$  is monotone, defining the *minimal authorised subsets*  $\Gamma_0$  is sensible.
- ▶ The matroid on  $\Gamma$  is defined by:

$$\Gamma_0 = \{A \subseteq \mathcal{P} \mid A \cup \{D\} \text{ is a circuit of } \mathbf{M}\}$$

- ▶ These matroids are **not** secret-sharing matroids.
- ▶ These matroids have a lot to do with matroid ports, and an excluded minor characterisation was given by Seymour in 1976.

# Perfect Secret Sharing

# Perfect Secret Sharing

- ▶ A secret sharing scheme with access structure  $\Gamma$  is *perfect* if:

# Perfect Secret Sharing

- ▶ A secret sharing scheme with access structure  $\Gamma$  is *perfect* if:
  - ▶ If  $\gamma \in \Gamma$ , then  $\gamma$  can compute  $K$ .

# Perfect Secret Sharing

- ▶ A secret sharing scheme with access structure  $\Gamma$  is *perfect* if:
  - ▶ If  $\gamma \in \Gamma$ , then  $\gamma$  can compute  $K$ .
  - ▶ If  $\gamma \notin \Gamma$ , then  $\gamma$  can determine nothing at all about  $K$  (that is, given the information available to  $\gamma$ , no value of  $K$  is more likely than any other).

# Perfect Secret Sharing

- ▶ A secret sharing scheme with access structure  $\Gamma$  is *perfect* if:
  - ▶ If  $\gamma \in \Gamma$ , then  $\gamma$  can compute  $K$ .
  - ▶ If  $\gamma \notin \Gamma$ , then  $\gamma$  can determine nothing at all about  $K$  (that is, given the information available to  $\gamma$ , no value of  $K$  is more likely than any other).
- ▶ Both threshold schemes introduced earlier are perfect.

# Ideal Secret Sharing

# Ideal Secret Sharing

- ▶ A perfect secret sharing scheme is *ideal* if:

# Ideal Secret Sharing

- ▶ A perfect secret sharing scheme is *ideal* if:
  - ▶ The “length” of  $K$  is the same as the “length” of the shares.

# Ideal Secret Sharing

- ▶ A perfect secret sharing scheme is *ideal* if:
  - ▶ The “length” of  $K$  is the same as the “length” of the shares.
- ▶ This is deliberately vague, though it can be formalised if one limits the origin of the secret.

# Ideal Secret Sharing

- ▶ A perfect secret sharing scheme is *ideal* if:
  - ▶ The “length” of  $K$  is the same as the “length” of the shares.
- ▶ This is deliberately vague, though it can be formalised if one limits the origin of the secret.
- ▶ Both threshold schemes introduced earlier are ideal, as all fields elements have the same “length”.

## Secret Sharing Matrix – Definition

## Secret Sharing Matrix – Definition

Let  $\mathbf{A} = [a_{ij} \mid i \in \mathbf{I}, j \in \mathbf{J}]$  be a finite matrix with entries from a finite set  $\mathbf{S}$  such that  $|\mathbf{S}| > 1$ .

## Secret Sharing Matrix – Definition

Let  $A = [a_{ij} \mid i \in I, j \in J]$  be a finite matrix with entries from a finite set  $S$  such that  $|S| > 1$ . For  $i \in I$ ,  $j \in J$ , and  $X \subseteq J - \{j\}$ , let

$$n(i, j, X) = \left\{ a_{kj} \mid k \in I, a_{kx} = a_{ix} \text{ for all } x \in X \right\}.$$

## Secret Sharing Matrix – Definition

Let  $A = [a_{ij} \mid i \in I, j \in J]$  be a finite matrix with entries from a finite set  $S$  such that  $|S| > 1$ . For  $i \in I$ ,  $j \in J$ , and  $X \subseteq J - \{j\}$ , let

$$n(i, j, X) = \{a_{kj} \mid k \in I, a_{kx} = a_{ix} \text{ for all } x \in X\}.$$

Then  $A$  is a **secret sharing matrix** over  $S$  if for all  $j \in J$  and all  $X \subseteq J - \{j\}$ , either  $n(i, j, X) = S$  for all  $i \in I$ , or  $|n(i, j, X)| = 1$  for all  $i \in I$ .

## Secret Sharing Matrix – Example

# Secret Sharing Matrix – Example

This is a secret-sharing matrix with  $S = \{\heartsuit, \spadesuit\}$ .

	a	b	c	d	e	f
1						
2						
3						
4						
5						
6						
7						
8						

## Secret Sharing Matrix – Example

This is a secret-sharing matrix with  $S = \{\heartsuit, \spadesuit\}$ .

	a	b	c	d	e	f
1						
2						
3						
4						
5						
6						
7						
8						

Consider  $j = d$  and  $X = \{a, b\}$ . Then  $n(i, d, \{a, b\}) = \{\heartsuit, \spadesuit\}$  for all  $i$ .

## Secret Sharing Matrix – Example

This is a secret-sharing matrix with  $S = \{\heartsuit, \spadesuit\}$ .

	a	b	c	d	e	f
1						
2						
3						
4						
5						
6						
7						
8						

Consider  $j = d$  and  $X = \{a, b\}$ . Then  $n(i, d, \{a, b\}) = \{\heartsuit, \spadesuit\}$  for all  $i$ .

Consider  $j = d$  and  $X = \{c, e\}$ . Then  $|n(i, d, \{c, e\})| = 1$  for all  $i$ .

# Secret Sharing Matrix – Implementation

# Secret Sharing Matrix – Implementation

- ▶ The secret sharing matrix  $A$  is assumed to be public knowledge.

# Secret Sharing Matrix – Implementation

- ▶ The secret sharing matrix  $\mathbf{A}$  is assumed to be public knowledge.
- ▶ Label the columns with  $\mathcal{P} \cup \{D\}$ .

# Secret Sharing Matrix – Implementation

- ▶ The secret sharing matrix  $\mathbf{A}$  is assumed to be public knowledge.
- ▶ Label the columns with  $\mathcal{P} \cup \{\mathbf{D}\}$ .
- ▶ We can assume  $\mathbf{D}$  is the first column.

# Secret Sharing Matrix – Implementation

- ▶ The secret sharing matrix  $\mathbf{A}$  is assumed to be public knowledge.
- ▶ Label the columns with  $\mathcal{P} \cup \{\mathbf{D}\}$ .
- ▶ We can assume  $\mathbf{D}$  is the first column.
- ▶  $\mathbf{D}$  picks row  $q$  uniformly at random from  $\mathbf{A}$ .

## Secret Sharing Matrix – Implementation

- ▶ The secret sharing matrix  $\mathbf{A}$  is assumed to be public knowledge.
- ▶ Label the columns with  $\mathcal{P} \cup \{\mathbf{D}\}$ .
- ▶ We can assume  $\mathbf{D}$  is the first column.
- ▶  $\mathbf{D}$  picks row  $q$  uniformly at random from  $\mathbf{A}$ .
- ▶ The secret is  $A_{q1}$ , and participant  $p_i$  gets share  $A_{qp_i}$ .

## Secret Sharing Matrix – Implementation

- ▶ The secret sharing matrix  $\mathbf{A}$  is assumed to be public knowledge.
- ▶ Label the columns with  $\mathcal{P} \cup \{\mathbf{D}\}$ .
- ▶ We can assume  $\mathbf{D}$  is the first column.
- ▶  $\mathbf{D}$  picks row  $\mathbf{q}$  uniformly at random from  $\mathbf{A}$ .
- ▶ The secret is  $\mathbf{A}_{\mathbf{q}\mathbf{1}}$ , and participant  $\mathbf{p}_i$  gets share  $\mathbf{A}_{\mathbf{q}\mathbf{p}_i}$ .
- ▶ This gives an ideal secret sharing scheme with  $\gamma \in \wp(\mathcal{P})$  being authorised if and only if  $|\mathbf{n}(i, \mathbf{1}, \gamma)| = 1$  for all  $i$ .

## Secret Sharing Matrix – Example revisited

# Secret Sharing Matrix – Example revisited

$$A = \begin{matrix} & D & p_1 & p_2 & p_3 & p_4 & p_5 \\ \begin{matrix} 1 \\ 2 \\ 3 \\ 4 \\ 5 \\ 6 \\ 7 \\ 8 \end{matrix} & \left[ \begin{array}{cccccc} \heartsuit & \spadesuit & \heartsuit & \spadesuit & \heartsuit & \spadesuit \\ \heartsuit & \spadesuit & \spadesuit & \heartsuit & \heartsuit & \heartsuit \\ \heartsuit & \heartsuit & \heartsuit & \heartsuit & \spadesuit & \spadesuit \\ \heartsuit & \heartsuit & \spadesuit & \spadesuit & \spadesuit & \heartsuit \\ \spadesuit & \heartsuit & \heartsuit & \spadesuit & \heartsuit & \heartsuit \\ \spadesuit & \heartsuit & \spadesuit & \heartsuit & \heartsuit & \spadesuit \\ \spadesuit & \spadesuit & \heartsuit & \heartsuit & \spadesuit & \heartsuit \\ \spadesuit & \spadesuit & \spadesuit & \spadesuit & \spadesuit & \spadesuit \end{array} \right] \end{matrix}$$

- ▶ D picks row 3, so the secret is  $\heartsuit$ .

# Secret Sharing Matrix – Example revisited

$$A = \begin{matrix} & D & p_1 & p_2 & p_3 & p_4 & p_5 \\ \begin{matrix} 1 \\ 2 \\ 3 \\ 4 \\ 5 \\ 6 \\ 7 \\ 8 \end{matrix} & \left[ \begin{array}{cccccc} \heartsuit & \spadesuit & \heartsuit & \spadesuit & \heartsuit & \spadesuit \\ \heartsuit & \spadesuit & \spadesuit & \heartsuit & \heartsuit & \heartsuit \\ \heartsuit & \heartsuit & \heartsuit & \heartsuit & \spadesuit & \spadesuit \\ \heartsuit & \heartsuit & \spadesuit & \spadesuit & \spadesuit & \heartsuit \\ \spadesuit & \heartsuit & \heartsuit & \spadesuit & \heartsuit & \heartsuit \\ \spadesuit & \heartsuit & \spadesuit & \heartsuit & \heartsuit & \spadesuit \\ \spadesuit & \spadesuit & \heartsuit & \heartsuit & \spadesuit & \heartsuit \\ \spadesuit & \spadesuit & \spadesuit & \spadesuit & \spadesuit & \spadesuit \end{array} \right] \end{matrix}$$

- ▶ D picks row 3, so the secret is  $\heartsuit$ .
- ▶  $p_2$  and  $p_4$  get together, and can reduce the possible rows to 3 or 7, but the secret is still safe.

# Secret Sharing Matrix – Example revisited

$$A = \begin{array}{c} 1 \\ 2 \\ 3 \\ 4 \\ 5 \\ 6 \\ 7 \\ 8 \end{array} \begin{array}{c} D \\ p_1 \\ p_2 \\ p_3 \\ p_4 \\ p_5 \end{array} \begin{bmatrix} \heartsuit & \spadesuit & \heartsuit & \spadesuit & \heartsuit & \spadesuit \\ \heartsuit & \spadesuit & \spadesuit & \heartsuit & \heartsuit & \heartsuit \\ \heartsuit & \heartsuit & \heartsuit & \heartsuit & \spadesuit & \spadesuit \\ \heartsuit & \heartsuit & \spadesuit & \spadesuit & \spadesuit & \heartsuit \\ \spadesuit & \heartsuit & \heartsuit & \spadesuit & \heartsuit & \heartsuit \\ \spadesuit & \heartsuit & \spadesuit & \heartsuit & \heartsuit & \spadesuit \\ \spadesuit & \spadesuit & \heartsuit & \heartsuit & \spadesuit & \heartsuit \\ \spadesuit & \spadesuit & \spadesuit & \spadesuit & \spadesuit & \spadesuit \end{bmatrix}$$

- ▶ D picks row 3, so the secret is  $\heartsuit$ .
- ▶  $p_2$  and  $p_4$  get together, and can reduce the possible rows to 3 or 7, but the secret is still safe.
- ▶ They then torture  $p_1$  and can now determine that the secret is  $\heartsuit$ .

# Representable Matroids

# Representable Matroids

- ▶ All matroids representable over a finite field are secret sharing.

# Representable Matroids

- ▶ All matroids representable over a finite field are secret sharing.
- ▶ Take a matrix representation of the matroid and construct the rowspace.

# Representable Matroids

- ▶ All matroids representable over a finite field are secret sharing.
- ▶ Take a matrix representation of the matroid and construct the rowspace.
- ▶ When viewed as a matrix, the rowspace is a secret sharing matrix.

$M(K_4)$

# $M(K_4)$

Take a  $GF(2)$ -representation  
of  $M(K_4)$ :

# $M(K_4)$

Take a  $GF(2)$ -representation  
of  $M(K_4)$ :

$$M = \begin{bmatrix} 1 & 0 & 0 & 1 & 1 & 1 \\ 0 & 1 & 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 1 & 0 & 1 \end{bmatrix}$$

# $M(K_4)$

The rowspace of  $M$  is:

Take a  $GF(2)$ -representation  
of  $M(K_4)$ :

$$M = \begin{bmatrix} 1 & 0 & 0 & 1 & 1 & 1 \\ 0 & 1 & 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 1 & 0 & 1 \end{bmatrix}$$

# $M(K_4)$

Take a  $GF(2)$ -representation  
of  $M(K_4)$ :

$$M = \begin{bmatrix} 1 & 0 & 0 & 1 & 1 & 1 \\ 0 & 1 & 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 1 & 0 & 1 \end{bmatrix}$$

The rowspace of  $M$  is:

$$\begin{bmatrix} 1 & 0 & 1 & 0 & 1 & 0 \\ 1 & 0 & 0 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 0 & 0 \\ 1 & 1 & 0 & 0 & 0 & 1 \\ 0 & 1 & 1 & 0 & 1 & 1 \\ 0 & 1 & 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 1 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

# $M(K_4)$

Take a  $GF(2)$ -representation  
of  $M(K_4)$ :

$$M = \begin{bmatrix} 1 & 0 & 0 & 1 & 1 & 1 \\ 0 & 1 & 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 1 & 0 & 1 \end{bmatrix}$$

This is the example from earlier.

The rowspace of  $M$  is:

$$\begin{bmatrix} 1 & 0 & 1 & 0 & 1 & 0 \\ 1 & 0 & 0 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 0 & 0 \\ 1 & 1 & 0 & 0 & 0 & 1 \\ 0 & 1 & 1 & 0 & 1 & 1 \\ 0 & 1 & 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 1 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

Vamos

# Vamos

- ▶ For any subset  $X \subseteq S$ , let  $\rho_X^S : F^S \rightarrow F^X$  be the mapping induced by the inclusion mapping  $X \hookrightarrow S$ .
- ▶ A  $q$ -ary **code** of length  $n$  is a non-empty subset of  $F^S$ .
- ▶ The image  $\rho_X^S(\mathcal{C})$  of a code  $\mathcal{C}$  under  $\rho_X^S$  will be denoted by  $\mathcal{C}_X$ .
- ▶ We say that  $\mathcal{C}_X$  is the **projection** of  $\mathcal{C}$  into the coordinate space  $F^X$ .

## Almost Affine Codes

- ▶ Let  $F$  be a finite set of size  $q \geq 2$ .
- ▶ Consider  $F^S$ , the set of all mappings from  $S \stackrel{\text{def}}{=} \{1, \dots, n\}$  into  $F$ .
- ▶ For any subset  $X \subseteq S$ , let  $\rho_X^S : F^S \rightarrow F^X$  be the mapping induced by the inclusion mapping  $X \hookrightarrow S$ .
- ▶ A  $q$ -ary **code** of length  $n$  is a non-empty subset of  $F^S$ .
- ▶ The image  $\rho_X^S(\mathcal{C})$  of a code  $\mathcal{C}$  under  $\rho_X^S$  will be denoted by  $\mathcal{C}_X$ .
- ▶ We say that  $\mathcal{C}_X$  is the **projection** of  $\mathcal{C}$  into the coordinate space  $F^X$ .
- ▶ A code  $\mathcal{C} \subseteq F^S$  is called **almost affine** if it satisfies the condition  $r(X) \stackrel{\text{def}}{=} \log_q(|\mathcal{C}_X|) \in \mathbb{Z}^+ \cup \{0\}$  for all  $X \subseteq S$ .

# Multilinear Codes

# Multilinear Codes

- ▶ Let  $\mathbf{F}$  be a  $m$ -dimensional vector space over  $\mathbf{GF}(q)$  and let  $\mathcal{C}$  be a linear subspace of the  $nm$ -dimensional vector space  $\mathbf{F}^n$ .

# Multilinear Codes

- ▶ Let  $F$  be a  $m$ -dimensional vector space over  $GF(q)$  and let  $C$  be a linear subspace of the  $nm$ -dimensional vector space  $F^n$ .
- ▶ Then  $C$  is an almost affine code of length  $n$  over  $F$  if and only if for all subsets  $X \subseteq \{1, \dots, n\}$  the dimension of the vector space  $C_X$  is divisible by  $m$ .

# Multilinear Codes

- ▶ Let  $F$  be a  $m$ -dimensional vector space over  $GF(q)$  and let  $C$  be a linear subspace of the  $nm$ -dimensional vector space  $F^n$ .
- ▶ Then  $C$  is an almost affine code of length  $n$  over  $F$  if and only if for all subsets  $X \subseteq \{1, \dots, n\}$  the dimension of the vector space  $C_X$  is divisible by  $m$ .
- ▶ These codes are known as *multilinear codes*.

# Matroids from codes

# Matroids from codes

- ▶ Let  $\mathcal{C} \subseteq F^S$  be an almost affine code, and let  $\wp(S)$  be the power set of  $S$ .

# Matroids from codes

- ▶ Let  $\mathcal{C} \subseteq \mathbb{F}^S$  be an almost affine code, and let  $\wp(S)$  be the power set of  $S$ .
- ▶ Let  $r(X)$  be defined as before:

# Matroids from codes

- ▶ Let  $\mathcal{C} \subseteq \mathbb{F}^S$  be an almost affine code, and let  $\wp(S)$  be the power set of  $S$ .
- ▶ Let  $r(X)$  be defined as before:  
 $r(X) \stackrel{\text{def}}{=} \log_q(|\mathcal{C}_X|) \in \mathbb{Z}^+ \cup \{0\}$  for  $X \subseteq S$ .

## Matroids from codes

- ▶ Let  $\mathcal{C} \subseteq \mathbb{F}^S$  be an almost affine code, and let  $\wp(S)$  be the power set of  $S$ .
- ▶ Let  $r(X)$  be defined as before:  
$$r(X) \stackrel{\text{def}}{=} \log_q(|\mathcal{C}_X|) \in \mathbb{Z}^+ \cup \{0\} \text{ for } X \subseteq S.$$
- ▶ Then  $r(X)$  is the rank function of a matroid  $\mathcal{M}(\mathcal{C})$  with  $S$  as its ground set.

## Matroids from codes

- ▶ Let  $\mathcal{C} \subseteq F^S$  be an almost affine code, and let  $\wp(S)$  be the power set of  $S$ .
- ▶ Let  $r(X)$  be defined as before:  
$$r(X) \stackrel{\text{def}}{=} \log_q(|\mathcal{C}_X|) \in \mathbb{Z}^+ \cup \{0\} \text{ for } X \subseteq S.$$
- ▶ Then  $r(X)$  is the rank function of a matroid  $M(\mathcal{C})$  with  $S$  as its ground set.
- ▶ A matroid  $M$  is said to be *almost affinely representable* if an almost affine code  $\mathcal{C}$  exists such that  $M = M(\mathcal{C})$ .

# Matroids from codes

- ▶ Let  $\mathcal{C} \subseteq F^S$  be an almost affine code, and let  $\wp(S)$  be the power set of  $S$ .
- ▶ Let  $r(X)$  be defined as before:  
$$r(X) \stackrel{\text{def}}{=} \log_q(|\mathcal{C}_X|) \in \mathbb{Z}^+ \cup \{0\} \text{ for } X \subseteq S.$$
- ▶ Then  $r(X)$  is the rank function of a matroid  $\mathcal{M}(\mathcal{C})$  with  $S$  as its ground set.
- ▶ A matroid  $\mathcal{M}$  is said to be *almost affinely representable* if an almost affine code  $\mathcal{C}$  exists such that  $\mathcal{M} = \mathcal{M}(\mathcal{C})$ .
- ▶ If  $\mathcal{C}$  is equivalent to a multilinear code, then  $\mathcal{M}$  is said to be *multilinearly representable*.

# Multilinear Matroid Example

## Multilinear Matroid Example

Let  $F = GF(3)^2$ . Then the rowspace of this matrix is an almost affine code of length 9 over  $F$ .

## Multilinear Matroid Example

Let  $F = GF(3)^2$ . Then the rowspace of this matrix is an almost affine code of length 9 over  $F$ .

$$\begin{bmatrix} 10 & 10 & 00 & 10 & 00 & 10 & 10 & 10 & 00 \\ 01 & 01 & 00 & 01 & 00 & 01 & 01 & 01 & 00 \\ 00 & 00 & 00 & 10 & 10 & 21 & 01 & 10 & 10 \\ 00 & 00 & 00 & 02 & 01 & 20 & 12 & 02 & 01 \\ 00 & 10 & 10 & 01 & 00 & 01 & 00 & 11 & 10 \\ 00 & 01 & 01 & 21 & 00 & 21 & 00 & 10 & 01 \end{bmatrix}$$

## Multilinear Matroid Example

Let  $F = GF(3)^2$ . Then the rowspace of this matrix is an almost affine code of length 9 over  $F$ .

$$\begin{bmatrix} 10 & 10 & 00 & 10 & 00 & 10 & 10 & 10 & 00 \\ 01 & 01 & 00 & 01 & 00 & 01 & 01 & 01 & 00 \\ 00 & 00 & 00 & 10 & 10 & 21 & 01 & 10 & 10 \\ 00 & 00 & 00 & 02 & 01 & 20 & 12 & 02 & 01 \\ 00 & 10 & 10 & 01 & 00 & 01 & 00 & 11 & 10 \\ 00 & 01 & 01 & 21 & 00 & 21 & 00 & 10 & 01 \end{bmatrix}$$

The matroid of this code is the non-Pappus matroid, showing that representable matroids are a proper subclass of secret sharing matroids.
